

Netmail Platform VM Deployment Requirements

The main components of the Netmail Platform now come as prepackaged virtual machines, ready to be deployed in a virtual infrastructure. Netmail Secure, Netmail Archive, and the Index Server can all be deployed and set up much more rapidly through a very simple deployment wizard, reducing the installation time from hours to mere minutes. This section provides the requirements information you need before deploying the Netmail Platform. Once you review the requirements, you can proceed to the [Netmail Deployment Center](#).

The requirements and deployment instructions outlined here apply to Netmail Platform VM deployments only.
