

Customizing the field labels on Netmail Search login screen

Environment

Netmail Search 6.1 / 6.2

Synopsis

Netmail Search label strings are stored in editable text files for every supported language. This article explains how to customize them for your needs.

Solution

Netmail Search label strings are stored in C:\Program Files (x86)\Messaging Architects\RemoteProvider\WebContent\resources\locale\. To change strings for the English Language, edit the "app-lang-en.txt" file.

For example, to change the "User Name" field label on the login page to be "Email Address", open the **app-lang-en.txt** file and replace "**User Name**:" with "**User Name**:" **Email Address**" and then save the file.

String changes will be recognized after a restart of the *Netmail Client Access* service. Also it is recommended to clear your browser cache before reloading the page, so that the new changes are immediately visible.

See [Customizing the Login Screen](#).

Notes

It is recommended to make a backup of any configuration file *before* editing, in case the edit is incorrect and causes issues.

It is also recommended to make a backup of the file *after* editing, because subsequent Netmail patches may overwrite these changes and restore the defaults.
